

African Violet

Care Tips:

All You Need To Know

Never water on top of my leaves or flowers, but always from the bottom, with tepid water. Cold water causes leaf spotting and curling. Don't use soft water or highly chlorinated water.

Keep me moist, but always allow my roots to dry out before watering, as this encourages my blooming!

Let me sit in 3/4" of water, I will absorb all I need. After 5-7 minutes, remove the excess water. Never let me sit in water for more than 30 minutes!

If I'm not getting the light I need, I will stop flowering, my leaves will yellow and stem will elongate. If too bright, my leaves will scorch and curl.

East or northeast facing windows are ideal; use shears or blinds if I'm facing south or west!

I thrive in medium indirect light. Rotate me once a week so that I will receive an even amount of light, or I will bend towards the side with most light.

Make sure to use a 100% water soluble African violet fertilizer (7-9-5).

Repot me about twice a year using a very light and porous soil. Choose a pot bigger of roughly one inch than the current!

Keep me around 20° C (70° F), and make sure to provide with at least 50-60% humidity!
